1교시 시작

어제 가상환경 폴더 만든 다음에

이 파일들 넣어줌

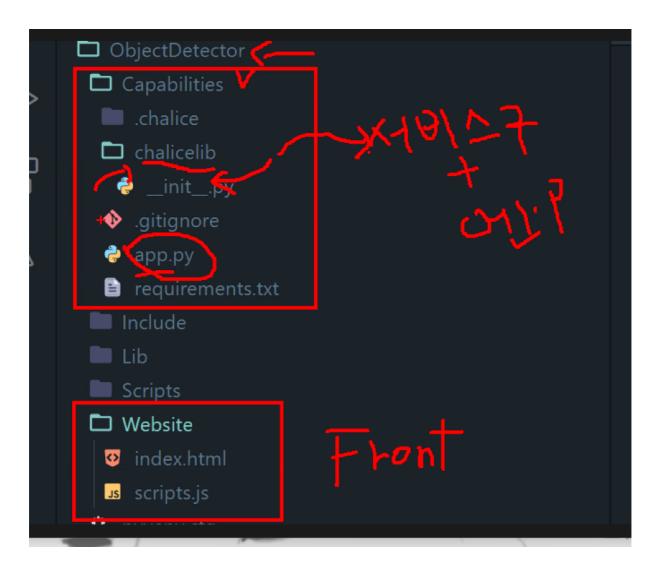

▼ recognition service.py

https://s3-us-west-2.amazonaws.com/secure.notion-static.com/749ff4bc-2cd5-4fcd-84d3-befce699bb27/recognition_service.py

▼ storage_service.py

https://s3-us-west-2.amazonaws.com/secure.notion-static.com/cd8610f8-1503-47a2-998d-a42bfefcb34a/storage_service.py

```
import boto3
class StorageService:
   def __init__(self):
       self.client = boto3.client('s3', 'ap-northeast-2')
   def get_all_files(self,buck_name):
       response = self.client.list_objects_v2(Bucket = buck_name)
       files = []
        for content in response['Contents']:
            files.append({
                'location': buck_name,
                'file_name': content['Key'],
                'url':f"http://s3.ap-northeast-2.amazonaws.com/{buck_name}/{content['Key']}"
                # 'url': "http://" + self.bucket_name + ".s3.amazonaws.com/"
                        + content['Key']
           })
        return files
```

엔드포인트 관리는 <u>app.py</u> 에서 함

1. 가상환경 활성화

ObjectDetector\Scripts\Activate

2. 가상환경 들어온 다음에 이렇게 해주고

cd ObjectDetector

(ObjectDetector) C:\Users\SBAUser\Desktop\23.04.03 AWS>cd ObjectDetector

3. cd Capabilities

```
(ObjectDetector) E:\Devpy\16.AWS\AI_Service\0.student\ObjectDetector>cd Capabilities

(ObjectDetector) E:\Devpy\16.AWS\AI_Service\0.student\ObjectDetector\Capabilities>
```

4. 로컬 기동 해주기

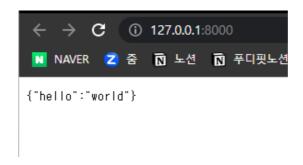

chalice local

```
(ObjectDetector) E:\Devpy\16.AWS\AI_Service\0.student\ObjectDetector\Capabilities>chalice local
Serving on http://127.0.0.1:8000
Restarting local dev server.
Serving on http://127.0.0.1:8000
```

5. 로컬 들어가보기 ctrl 좌클릭

```
(ObjectDetector) C:\Users\SBAUser\Desktop\23.04.03 AWS\ObjectDetector\Capabilities>chalice local Serving on http://127.0.0.1:8000
Restarting local dev server.
Serving on http://127.0.0.1:8000
127.0.0.1 - - [05/Apr/2023 09:36:04] "GET / HTTP/1.1" 200 - 127.0.0.1 - - [05/Apr/2023 09:36:04] "GET /favicon.ico HTTP/1.1" 403 - [
```

6. 그러면 hello world가 있음!

왜냐하면 app.py에 return 값이 저랬기 때문

```
from chalice import Chalice

app = Chalice(app_name='Capabilities')

@app.route('/')
def index():
    return { 'hello': 'world'}
```

7. 저기 내용을 고치면 아래와 같이 나타남

```
pertDetector > Capabilities > @ app.py > @ index

1   from chalice import Chalice

2   app = Chalice(app_name='Capabilities')

4   
5   @app.route('/')

7   def index():

8   return {'hello': 'hamster'}
```

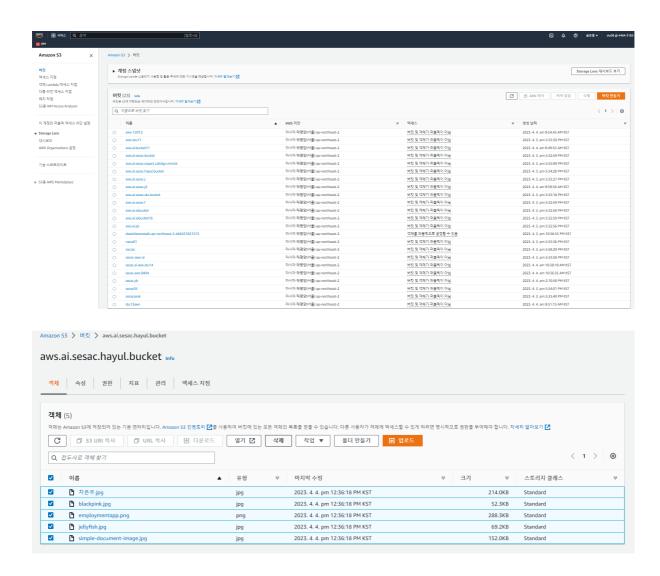

```
← → C ① 127.0.0.1:8000

N NAVER Z 중 N 노션 N 푸디팟

{"hello":"hamster"}
```

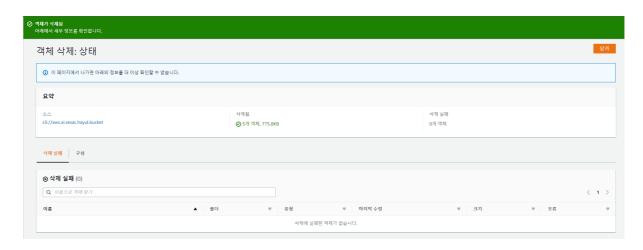

후후 일단 버킷부터 정리하러 가자 팀장 계정이어도 ㄱㅊ

8. AWS - Amazon S3로 가서

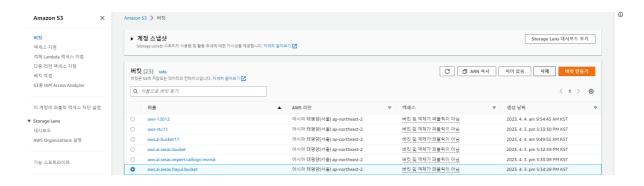

버킷 내에 있는 내용물을 삭제해야! 버킷을 지울 수 있으므로 내용물 삭제

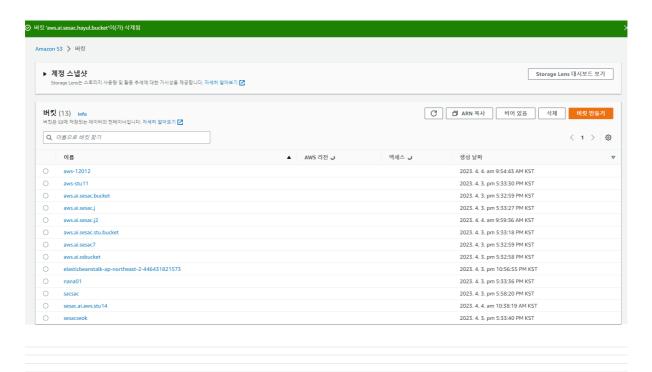

어어 삭제 완

버킷 삭제

버킷 삭제 완

S3 버킷 구성

등 S3 버킷 구성

- stu01.service.content
- stu01.service.website

Þ

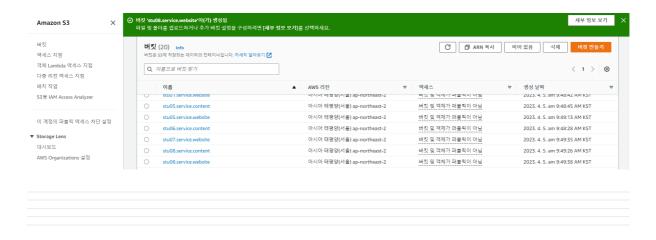

content는 백단, website는 프론트단으로 하는 것

stu08.service.content

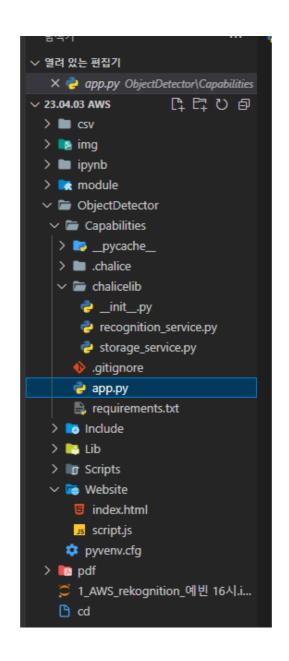

stu08.service.website

이렇게 버킷을 만들어줌

버킷 만들 때 설정들은 건들지 말고, 그냥 region만 서울로 설정하고 다 만들었음

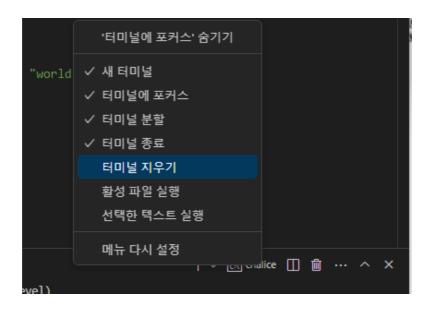

현재 파일 구성이 아래와 같음

그 전에

터미널 > 우클릭 해서 kill terminal 해주

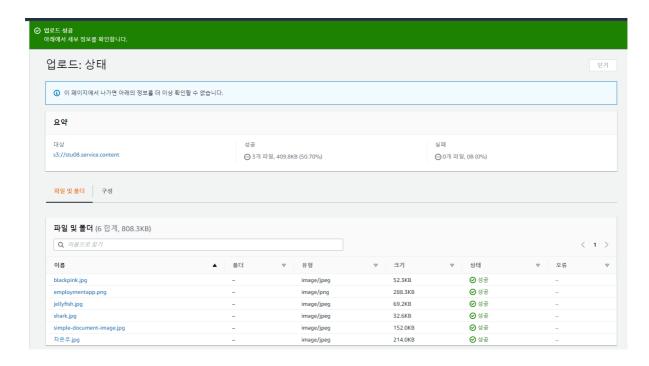

이제 <u>app.py</u> 수정하기.. 수정 중..

```
🥏 app.py
                                          ×
                                 ObjectDetector > Capabilities > 🔁 app.py > ...
